

PROBLEM STATEMENT

A Crypt Arithmetic Problem is a type of logic puzzle in which letters are used instead of digits in an arithmetic equation. The objective is to assign a unique digit (0–9) to each letter so that the arithmetic equation becomes mathematically correct. Each letter must represent a different digit, and no two letters can have the same value. Additionally, the first letter of a number cannot be assigned the digit zero.

For example:

```
  SEND
+ MORE
-----
 MONEY
```

The task is to determine the digit assigned to each letter such that the addition is correct.
