

REPORT

Title

Prolog Program for a Database with Name and Date of Birth

Aim

To create a simple database in Prolog containing the **name and DOB of persons** and retrieve the stored information using queries.

Problem Statement

Create a Prolog database that stores the name and date of birth of different persons and allows the user to retrieve their details.

Requirements

- SWI-Prolog
- Computer system
- Prolog source file (`exp2.pl`)

Procedure

1. Open **SWI-Prolog**.
2. Create a new file named `exp2.pl`.
3. Enter the person and DOB facts.
4. Save the file.
5. Load the file using `[exp2]..`
6. Query the database using a person's name.
7. Observe the corresponding DOB.

Program

```
person(pooja, date(15,5,2006)).  
person(rahul, date(10,8,2005)).  
person(priya, date(25,12,2006)).  
person(ashwin, date(3,2,2005)).  
person(karthik, date(18,7,2006)).
```

Sample Output

```
?- [exp2].  
true.
```

```
?- person(pooja, DOB).  
DOB = date(15, 5, 2006).
```

Conclusion

Thus, a simple **Prolog database containing names and dates of birth** was successfully created. The required DOB can be retrieved by querying the database with the person's name.
