

SOLUTION

1. Represent the Connect Four board using a 2D list.
2. The human player uses **X** and the computer uses **O**.
3. Generate all possible valid moves (columns that are not full).
4. For each possible computer move:
 - Temporarily place the computer's piece.
 - Evaluate the resulting board.
 - Use the **Minimax algorithm** to explore future human and computer moves.
5. The **Maximizing player** (computer) tries to maximize the score.
6. The **Minimizing player** (human) tries to minimize the score.
7. Give a high score for a computer win and a low score for a human win.
8. Select the move with the highest score.
9. Continue until a player wins or the board becomes full.
